DECLARATION

We hereby declare that the project work titled "**NextStep-Centralized Destination Wedding Planner**" submitted as part of Bachelor's degree in CSE, at Chitkara University, Punjab, is an authentic record of our own work carried out under the supervision of **Dr Ajay Kumar**

Name of students

Abhishek Duggal (2210991163)

Aaryan Kumar Goayal (2210991120)

Gauri Gupta (2210991574)

Evaluator Signature(s):

ACKNOWLEDGEMENT

It is our pleasure to be indebted to various people, who directly or indirectly contributed in the development of this work and who influenced my thinking, behavior, and acts during the course of my study.

We express our sincere gratitude to all for providing me an opportunity to undergo Integrated Project as part of the curriculum.

We are thankful to **Dr.Ajay Kumar** for her support, cooperation, and motivation provided to us during the training for constant inspiration, presence, and blessings.

Lastly, we would like to thank the almighty and our parents for their moral support and friends with whom we shared our day-to-day experience and received lots of suggestions that improve our quality of work.

ABSTRACT

The growing complexity of planning destination weddings involves many people, including users, planners, vendors, and administrators. Current methods rely on scattered communication and manual coordination. This causes inefficiency, delays, booking issues, and a lack of transparency.

This project, NextStep, suggests a web-based platform that brings all wedding planning services together in one system. It allows users to explore destinations using various filters, choose customized packages, and manage bookings in real time. The platform supports both planner-assisted and user-driven vendor selection, offering flexibility based on user choices.

The system includes role-specific dashboards to simplify operations. Planners can handle booking requests, assign vendors, and track task progress. Vendors receive assignments, manage their services, and take care of deliverables and invoicing. The admin module helps maintain system integrity through user approval processes and analytics monitoring, which includes booking trends and performance insights.

Built using the MERN stack, the platform ensures scalability, responsiveness, and efficient data management. It uses RESTful APIs, JWT-based authentication, and role-based access control to enhance security and manage access. The system design focuses on being modular and maintainable, making future upgrades easier.

The expected outcome is a significant reduction in planning time, better coordination among all parties, increased transparency in operations, and a smooth user experience. This platform aims to create a scalable and efficient solution for modern destination wedding planning by changing a traditionally disorganized process into a structured digital workflow.

PROBLEM STATEMENT

As you already know that planning a wedding destination is very tough process because it involves handling multiple things such as choosing venues coordinating with vendors, handling multiple bookings and look after different arrangements. Most of us rely of personal contacts which is very tough and confusing process and almost impossible to manage.

Because everything is decentralized and is not found at one single location, we encounter different kinds of problems such as lack of coordination and delayed communication. This increases both time and effort, especially when we are planning everything from different locations, creating the need of more organized and centralized platform where we can manage all these.

INTRODUCTION

Destination weddings are becoming very common nowadays. However, there are many components involved in destination wedding planning, including selecting venues, coordinating and communicating with other people involved such as users, planners, vendors, and administrators, and making bookings among others.

Most planning activities currently depend on personal connections and the use of several platforms. The use of several disconnected tools complicates things because there are coordination problems, late communications, and challenges in making bookings. Thus, there are no effective ways of comparing services, monitoring progress, and ensuring coordination of activities among all participants involved in the planning process.

Users may not find it easy to get accurate and reliable information about what they want, vendors find it hard to handle tasks efficiently, and planners are unable to manage requests easily because there are several components involved in the process. To make life easier for everyone involved in the wedding planning process, we present NextStep as a web-based solution that centralizes all wedding-related services.

TOOLS AND TECHNOLOGY

- **Frontend**: React.js
  Used to build a dynamic and responsive user interface. It enables component-based development, fast rendering, and smooth user experience for browsing destinations, managing bookings, and interacting with dashboards.

- **Backend:** Express.js
  Node.js provides a scalable runtime environment, while Express.js is used to create APIs and handle server-side logic. Together, they manage requests, process data, and connect the frontend with the database.

- **Database**: MongoDB
  Used to store all application data such as users, bookings, vendors, packages, and feedback. Its NoSQL structure allows flexible and scalable data handling.

- **Authentication:** JWT (JSON Web Tokens)
  Used to securely authenticate users. It ensures that only authorized users can access protected routes and maintains session management without storing sensitive data on the server.

- **Architecture:** RESTful APIs
  Enables communication between frontend and backend through standardized HTTP methods (GET, POST, PUT, DELETE). It ensures modular, scalable, and maintainable system design.

- **Security:** Role-Based Access Control (RBAC)
  Restricts system access based on user roles (User, Planner, Vendor, Admin). Ensures that each role can only access relevant features and data, improving system security and control.

METHODOLOGY

The system follows a role-based modular approach:

1. **Requirement Analysis**
   - Identify user roles: User, Planner, Vendor, Admin
   - Define system functionalities and workflows

2. **System Design**
   - Design database schema (MongoDB collections)
   - Define API structure
   - Create UI/UX wireframes

3. **Development**
    - Frontend built using React
    - Backend APIs using Node.js and Express
    - Integration with MongoDB

4. **Authentication & Authorization**
    - JWT-based login system
    - Role-based access control

5. **Testing**
    - Functional testing of each module
    - Integration testing

6. **Deployment**
    - Deploy web application on server

Key Features or Functionality

This web app is built for planning destination weddings which include four different roles: User, Planner, Vendor and Admin

Users can browse different destinations with functionality to search via filter different destination based on personal interest and requirements. We can also book a particular booking based on our requirements with just one click and fill out mendatory fields. We can also manage and track our booked bookings. If we want to give some personalized demands while booking some plan we can also tell to the planners. If we don't want planner to choose vendor on its own we can also select vendors based on our requirements which are available on our webapp. We can also give our feedback by filling out simple feedback form. At last, there is even an option for us to edit our personal profile information.

The planners have access to view all the booking requests which come their way along with all the user details such as any custom request, destination wedding dates, and much more. We can assign Vendors to a particular users based on their requirements and availability of vendors. We can update the progress of the tasks given by user like pending, confirmed, reject, cancelled and completed. We can also create different packages for the users.

Vendors shall be notified through assignments and handle booking information such as user information, date, planner, package, and any other special requirements. Upload of deliverables, invoicing, and offering services such as photography, decorations, and catering with their costs is possible.

Admin manages and create different destinations for the users and most importantly to look after all the users, vendors, planners who are using his web app. First of all first thing vendor and planner need is to get approved from the admin. Admin has the liberty to approve, reject or suspend vendors and planners based on there performance and feedbacks. Admin can also monitor analytics like total bookings, top destinations, top packages and top vendors

Conclusion

NextStep represents an efficient and streamlined web-based service for planning destination weddings that brings together users, planners, vendors, and admins into one system. The web application ensures efficient management of critical tasks such as choosing destinations, booking packages, assigning vendors, and monitoring progress. This way, it reduces dependence on inefficient communication and coordination mechanisms that characterize many of such planning services.

In implementing the proposed web application, MERN was used to ensure its scalability and responsiveness, while access control was provided by means of JSON Web Tokens and RBAC. Most importantly, core functions of the service were effectively tested, including booking, vendor coordination, and activities associated with different roles within the service.

Future Scope

- **AI-based Personalization**
  Integration of recommendation systems to suggest venues, vendors, and themes based on user preferences and past interactions.
- **Secure Online Payments**
  Implementation of payment gateways such as Stripe or Razorpay to enable secure and seamless transaction processing within the platform.
- **Real-time Communication**
  Addition of real-time chat functionality to improve coordination between users, planners, and vendors, reducing delays and miscommunication.
- **Mobile Application Development**
  Development of a dedicated mobile application to provide users with convenient, anytime and anywhere access to the platform.

About Plagiarism Detection

Our AI-powered plagiarism scans offer three layers of text similarity detection: Identical, Minor Changes, and Paraphrased. Based on your scan settings we also provide insight on how much of the text you are not scanning for plagiarism (Omitted words).

Identical

One to one exact word matches. Learn more

Minor Changes

Words that hold nearly the same meaning but have a change to their form (e.g. “large” becomes “largely”). Learn more

Paraphrased

Different words that hold the same meaning that replace the original content (e.g. "large" becomes "big") Learn more

Omitted Words

The portion of text that is not being scanned for plagiarism based on the scan settings. (e.g. the 'Ignore quotations' setting is enabled and the document is 20% quotations making the omitted words percentage 20%) Learn more

About AI Detection

Our AI Detector is the only enterprise-level solution that can verify if the content was written by a human or generated by AI, including source code and text that has been plagiarized or modified. Learn more

AI Text

A body of text that has been generated or altered by AI technology. Learn more

Human Text

Any text that has been fully written by a human and has not been altered or generated by AI. Learn more

Copyleaks AI Detector Effectiveness

Credible data at scale, coupled with machine learning and widespread adoption, allows us to continually refine and improve our ability to understand complex text patterns, resulting in over 99% accuracy—far higher than any other AI detector—and improving daily. Learn more

Ideal Text Length

The higher the character count, the easier for our technology to determine irregular patterns, which results in a higher confidence rating for AI detection. Learn more

Reasons It Might Be AI When You Think It's Not

The AI Detector can detect a variety of AI-generated text, including tools that use AI technology to paraphrase content, auto-complete sentences, and more. Learn more

User AI Alert History

Historical data of how many times a user has been flagged for potentially having AI text within their content. Learn more

AI Logic

The number of times a phrase was found more frequently in AI vs human text is shown according to low, medium, and high frequency. Learn more
